

Computing at the edge

Deliverable 1: Final year Dissertation

Bsc Computer Science: Artificial Intelligence

Sam Fay-Hunt — `sf52@hw.ac.uk`

Supervisor: Rob Stewart — `R.Stewart@hw.ac.uk`

October 16, 2020

DECLARATION

I, Sam Fay-Hunt confirm that this work submitted for assessment is my own and is expressed in my own words. Any uses made within it of the works of other authors in any form (e.g., ideas, equations, figures, text, tables, programs) are properly acknowledged at any point of their use. A list of the references employed is included.

Signed:

Date:

Abstract: a short description of the project and the main work to be carried out – probably between one and two hundred words

1 Introduction

Summarising the context of the dissertation project, stating the aim and objectives of the project, identifying the problems to be solved to achieve the objectives, and sketching the organisation of the dissertation.

Edge devices have never been cheaper *citation*, stuff about how IoT devices are ubiquitous

Mention how there is an increasing trend to perform computing at the Edge - real time applications + privacy

These devices are often equipped with some form of AI application: Photo enhancement ect.

Online vs offline learning

Edge-side inference

These models can have a huge number of parameters so inference can sometimes be impractical. [1] - “see Table 1”

Issues with limited resource computation [2]

outline the document: We start with ..., then we cover x, y, and z ...

This dissertation is an investigation into the effect of pruning on inference in terms of latency and accuracy using hardware without specific optimisations for processing the resulting sparse matrices from pruning. (Reasoning for statement...).

2 Background

Discussing related work found in the technical literature and its relevance to your project.

This Section will be split into 4 subsections:

Hardware Memory architectures Section 2.1 - brief stuff about this section

Edge Computing Section 2.2 - stuff about edge comp

Deep Learning Section 2.3 - stuff

Compression Types Section 2.4 - ...

2.1 Hardware memory architectures

- Discuss VPU/TPU/APU/GPU/FPGA/ASIC memory architecture and how it handles matrix sparsity

- Show ineffectivity of pruning on hardware without optimisations for sparse matrices

The explosion of Deep Neural Network applications in recent years has prompted the production of a wave of specialised hardware architectures to improve the efficiency and compute of these kinds of workloads. The mainstay of this form of processing has been until recently been dominated by GPUs.

2.2 Computing at the edge

Some background on edge computing - maybe a detailed definition

- Challenges of resource bound deep learning

- Online vs offline learning

2.3 Deep Neural Networks

Types of deep learning & inference

Deep Neural Network (DNN)

- *Layer structure (Input, Hidden, output) - Weight parameters updated using back-propagation*

2.3.1 Neural Networks & Deep Learning

- *Summary of NN*
- *Structure of NN*
- *Training & Inference stages*
- *weight update methodologies*
- *Feed Forwards*
- *Feedback Neural Network*
- *Self-organizing Neural Network*

Deep learning is a category of machine learning techniques where a hierarchy of layers that perform some manner of information processing that computes high level abstractions of the data by identifying low level abstractions in the early layers [3]. Neural networks are a subfield within the category of Artificial Intelligence computing. Neural networks are composed of layers of neurons that pass signals derived from weights through the network, this model of computing was inspired by connectionism and our understanding of the human brain, see Fig. 1 for labels of the analogous biological components. Weights in a neural network effectively correspond to the synapses in the brain and the output of the neuron is modelled as the axon. All neurons in a Neural network have weights corresponding to their inputs, these weights are intended to mirror the value scaling effect of a synapse by performing a weighted sum operation. The neuron then applies a non-linear activa-

Figure 1: Neuron with corresponding biologically inspired labels.
(Adopted figure from [2])

tion function to the result, without which a neural network would just be a linear algebra operation [2].

Neural networks and deep neural networks are often referred to interchangeably, they are primarily distinguished by the number of layers, generally a network with more than 3 layers is considered a deep neural network, the rest of this paper will refer to DNNs for consistency.

DNNs have an input layer, an output layer and many interior layers (between the input and output layer) that are referred to as *hidden layers*

DNNs can be categorised as feedforwards, feedback, and self-organising networks depending on their processing method [1].

There are many popular deep neural network architectures, the full scope of these are

beyond the scope of this document. The next sections will focus primarily on the CNN and RNN architectures.

2.3.2 Convolutional Neural Network

Convolutional Neural Network (CNN)

- *A class of DNN*

- *CNN consist of: Convolutional Layers, Pooling layers & fully connected layers.*

- *Convolutional Layers contain sets of filters/kernels* Much like traditional neural networks the CNN architecture was inspired by human and animal brains, the concept of processing the input with local receptive fields is conceptually similar some functionality of the cat's visual cortex [4]–[6]. These local receptive fields (or kernels) enable neurons to extract low level features such as edges, corners, and end-points with respect to their orientation. CNNs are robust to input shift or distortion by using receptive fields to identify these low level features across the entire input space, performing local averaging and downsampling in the layers following convolution layers means the absolute location of the features is less important than the position of the features relative to the position of other identified features [5]. Each layer produces higher degrees of abstraction from the input layer, in doing so these abstractions retain important information about the input, these abstractions are referred to as feature maps. The layers performing downsampling are known as pooling layers, they reduce the resolution or dimensions of the feature map which reduces overfitting and speeds up training by reducing the number of parameters in the network [6].

CNNs have been found to be effective in many different AI domains, popular applications include: computer vision, NLP, and speech processing.

Figure 2: A typical example of a CNN (left) and RNN (right)
(Adopted figure from [1])

2.3.3 Recurrent Neural Network

Recurrent Neural Network (RNN)

RNNs are deep learning models that use loops in their layer connections to make predictions with sequential inputs and maintain state over those inputs, this architecture is designed specifically for time series predictions [7].

2.4 Compression types

pruning

distillation

Quantization

Network design strategies

low-rank factorization

3 Research Methodology/ Requirements Analysis

3.1 Research Methodology

This is required for research projects and should be linked back to the project aim and objectives. It should describe the research methods that will be employed in the project and the research questions that will be investigated.

1. build dataset of benchmarks from my systematic benchmark framework from models
2. perform pruning on models
3. run benchmark again with pruning
4. make adjustments to underlying mechanism of parameter storage
5. verify adjustments do not break the model
5. run benchmarks again
6. draw conclusions

Find baselines/benchmarks

How to perform pruning

Look at underlying storage mechanism of parameters in Network

- provide some plots visualising the sparsity of the weights for the pruned matrix

perform some engineering of refactoring/altering these mechanisms

rerun systematic benchmarking framework

3.2 Requirements Analysis

This is required for technical projects and should be linked back to the project aim and objectives. It should provide a detailed use case scenario and suitable use

4 Design

Initial software design/sketch of research Methodology

5 Evaluation Strategy

Details of the evaluation and analysis to be conducted

6 Project Management

6.1 Plan

6.2 Risk Analysis

mention benchmarking NLP/NLG/Audio - text/text - audio models as a risk to the project

6.3 Professional, Legal & Ethical issues
